

*At Line of Site Designs, we realize that in today's competitive market, businesses must keep pace with the speed of thought.*

Line of Site Designs Inc. is a specialized IT firm that is comprised of a "co-op" of associates, rather than full-time employees. This allows us to draw on expertise on a project-needed basis rather than the conventional method of hiring as needs develop which is extremely cost and time effective. Within our co-op we cover most areas of a client's developmental needs.

From cost and needs analysis to development realization, to data migration and Product lifecycle management. We have helped or lead the development of applications and software in such areas as  
Education, Engineering, Health Care, Retail,  
Media and Land Management using many different platforms and programming methods.

## Software and application development. Legacy data migration, interaction and legacy software conversion.

## Software Development Services

Line of Site Designs builds and supports software for **data access** and **integration**, **process automation**, manufacturing **business solutions** and **business communications**.

Our **high quality**, rapid implementation and excellent service give you greater productivity, faster speed to market and a solid ROI performance. This performance is valued by our customers, many who have been with us since our founding and many more who have come on board since then. Whether **N-Tier** or **Desktop** we have the experience that counts.

## GIS Applications and Data Management

Line of Site Designs also offers full GIS services. Using a number of tools including GeoMedia, ESRI and MapInfo, we can design custom GIS applications or build upon existing applications or data. From **small desktop situations** or **mobile solutions** to **complex GIS enabled applications** we have the skills and technology to see your ideas come to light.

## Application Conversions

Line of Site Designs understands that because methods become obsolete it doesn't have to mean that your applications you use become obsolete as well. The logic is there and its been proven for perhaps many years, but we have often found organizations running software systems that could be greatly enhanced, making it more user-friendly and able to save many hours of manual, usually tedious, effort. Often users and their managers are unaware of how much more **efficiently** processes can be implemented both on a day-to-day basis and in terms of a collective effort. Let us help your company realize its full potential by providing a **no hassle** overview of your current systems.

## Data Gathering and Presentation

Line of Site Designs has tremendous experience in getting the data that you need no matter where it resides or on what platform it is maintained. The recent major trends of systems modernization and transition to net-enabled technologies, together with extensive M&A activities in IT organizations, present a growing need for data integration technologies. IT organizations are required to provide greater data mobility for various purposes such as data warehousing, system migrations, data consolidations, inter-company data integration, and implementation of new application systems.

Line of Site Designs can represent your data, services or products on the **web** in a clear, concise and accurate manner. We have full access to excellent **media development expertise**, **copywriters**, **database analysts** and **web programming consultants**. The sky is truly the limit!

## Proprietary Software Interaction

**Add-on components for proprietary software systems** is one of Line of Site Designs specialties that enables you to get the data you need for your clients or users without the expensive proposition of having to purchase additional modules or licenses from your software retailer.

- JD Edwards
- Great Plains Dynamics
- Simply Accounting
- ACCPAC
- Oracle
- Ms SQL Server
- Access

### PDA Development (Palm/Windows CE)

can be programmed to run just about any application (or multiple applications) from the most basic to the very complex. Long, extensive and complex forms can be designed and programmed to allow rapid data entry, with logic and data validations. Simple graphics and signature captures can be stored for future uploads. Chances are, the process of filling out any paper form in the field could be greatly enhanced, both in speed and reliability, by using PDA devices. PDA devices can create efficiencies in business by allowing the rapid and seamless transfer of captured data from the handheld to the corporate database system. This means the inefficiencies and errors of manual data entry are removed.
